

Our dear friend and team pilot Chad Nowak spent some time in Europe on a variety of missions. He spent some time with the ImmersionRC crew working on new products and features, such as tuning the latest BetaFlight firmware release for the Vortex quadcopters, and testing the ImmersionRC Tramp VTx remote configuration through a FrSky Taranis LUA script.

Work didn't take up all of the time though - Chad got invited to fly at CERN in Switzerland, one of the largest and most respected centers for scientific research in the world. He also went to Belgium to meet with the Lugus Studio crew, who are actively developing the [Liftoff Simulator](#) in conjunction with ImmersionRC.

He also got a chance to sit down for a few drinks with BorisB, the developer of the popular BetaFlight firmware, and discuss the new BetaFlight FC while jesting about "32KHz" and "Super Secret Gyros".

Next destination on Nowak's list is China, where he will meet up with companies such as FatShark, T-Motor and FrSky, *hopefully* to make the future of drone racing much easier, more reliable and even more awesome for everyone! Right Chad?
